### Abstract

A stabbing protection lining (3) is described for a protection jacket (1) which is already provided with a ballistic protection package (2). This lining (3) can be placed in front of the ballistic protection packet and consists of a steel-chain network which is embedded in a flexible plastic matrix. The plastic matrix (5) gives the steel-chain mesh dimensional stability while still having a certain amount of flexibility. Furthermore, secondary fragments when hit by rounds from firearms are avoided.
